Impact of Severe Weather Events on Public Health and Economy in the United States

Synonpsis

In this report, we aim to analyze the impact of different weather events on public health and economy based on the storm database collected from the U.S. National Oceanic and Atmospheric Administration's (NOAA) from 1950 - 2011. We will use the estimates of fatalities, injuries, property and crop damage to decide which types of event are most harmful to the population health and economy. From these data, we found that excessive heat and tornado are most harmful with respect to population health, while flood, drought, and hurricane/typhoon have the greatest economic consequences.

Basic settings

```
echo = TRUE # Always make code visible
options(scipen = 1) # Turn off scientific notations for numbers
library(R.utils)
```

```
## Loading required package: R.oo
## Loading required package: R.methodsS3
## R.methodsS3 v1.7.1 (2016-02-15) successfully loaded. See ?R.methodsS3 for help.
## R.oo v1.20.0 (2016-02-17) successfully loaded. See ?R.oo for help.
##
## Attaching package: 'R.oo'
## The following objects are masked from 'package:methods':

library(ggplot2)
library(plyr)
require(gridExtra)

## Loading required package: gridExtra
```

Data Processing

First, we download the data file and unzip it.

```
if (!"repdata_data_StormData.csv.bz2" %in% dir("E:/Downloads/Compressed/")) {
    print("hhhh")
    download.file("http://d396qusza40orc.cloudfront.net/repdata%2Fdata%2FStormData.csv.bz2", de
    stfile = "E:/Downloads/Compressed/stormData.csv.bz2")
        bunzip2("E:/Downloads/Compressed/stormData.csv.bz2", overwrite=T, remove=F)
}
```

Then, we read the generated csv file. If the data already exists in the working environment, we do not need to load it again. Otherwise, we read the csv file.

```
if (!"stormData" %in% ls()) {
```

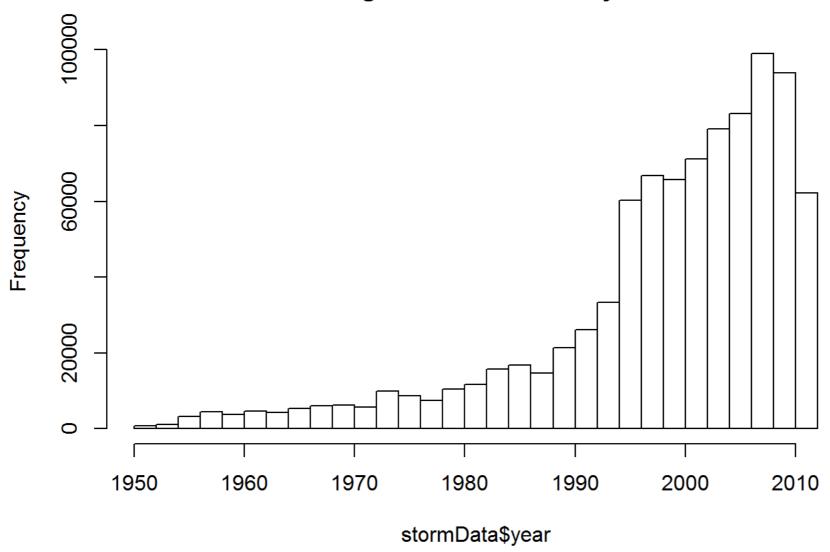

```
stormData <- read.csv("E:/Documents/stormData.csv", sep = ",")</pre>
dim(stormData)
## [1] 902297

```

There are 902297 rows and 37 columns in total. The events in the database start in the year 1950 and end in November 2011. In the earlier years of the database there are generally fewer events recorded, most likely due to a lack of good records. More recent years should be considered more complete.

```
if (dim(stormData)[2] == 37) {
```

```
stormData$year <- as.numeric(format(as.Date(stormData$BGN_DATE, format = "%m/%d/%Y %H:%M:%S</pre>
"), "%Y"))
hist(stormData$year, breaks = 30)
```

Histogram of stormData\$year

Based on the above histogram, we see that the number of events tracked starts to significantly increase around 1995. So, we use the subset of the data from 1990 to 2011 to get most out of good records.

storm <- stormData[stormData\$year >= 1995,]

```
dim(storm)

## [1] 681500 38
```

Now, there are 681500 rows and 38 columns in total.

Impact on Public Health

In this section, we check the number of **fatalities** and **injuries** that are caused by the severe weather events. We would like to get the first 15 most severe types of weather events.

```
sortHelper <- function(fieldName, top = 15, dataset = stormData) {
   index <- which(colnames(dataset) == fieldName)
   field <- aggregate(dataset[, index], by = list(dataset$EVTYPE), FUN = "sum")
   names(field) <- c("EVTYPE", fieldName)
   field <- arrange(field, field[, 2], decreasing = T)
   field <- head(field, n = top)
   field <- within(field, EVTYPE <- factor(x = EVTYPE, levels = field$EVTYPE))
   return(field)
}

fatalities <- sortHelper("FATALITIES", dataset = storm)
injuries <- sortHelper("INJURIES", dataset = storm)</pre>
```

Impact on Economy

We will convert the **property damage** and **crop damage** data into comparable numerical forms according to the meaning of units described in the code book (Storm Events). Both PROPDMGEXP and CROPDMGEXP columns record a multiplier for each observation where we have Hundred (H), Thousand (K), Million (M) and Billion (B).

```
convertHelper <- function(dataset = storm, fieldName, newFieldName) {
```

```
totalLen <- dim(dataset)[2]
    index <- which(colnames(dataset) == fieldName)</pre>
    dataset[, index] <- as.character(dataset[, index])</pre>
    logic <- !is.na(toupper(dataset[, index]))</pre>
    dataset[logic & toupper(dataset[, index]) == "B", index] <- "9"</pre>
    dataset[logic & toupper(dataset[, index]) == "M", index] <- "6"</pre>
    dataset[logic & toupper(dataset[, index]) == "K", index] <- "3"</pre>
    dataset[logic & toupper(dataset[, index]) == "H", index] <- "2"</pre>
    dataset[logic & toupper(dataset[, index]) == "", index] <- "0"</pre>
    dataset[, index] <- as.numeric(dataset[, index])</pre>
    dataset[is.na(dataset[, index]), index] <- 0</pre>
    dataset <- cbind(dataset, dataset[, index - 1] * 10^dataset[, index])</pre>
    names(dataset)[totalLen + 1] <- newFieldName</pre>
    return(dataset)
storm <- convertHelper(storm, "PROPDMGEXP", "propertyDamage")</pre>
## Warning in convertHelper(storm, "PROPDMGEXP", "propertyDamage"): NAs

```

And the following is a pair of graphs of total fatalities and total injuries affected by these severe weather events.

```
fatalitiesPlot <- qplot(EVTYPE, data = fatalities, weight = FATALITIES, geom = "bar") +
    scale_y_continuous("Number of Fatalities") +
    theme(axis.text.x = element text(angle = 45,
   hjust = 1)) + xlab("Severe Weather Type") +
   ggtitle("Total Fatalities by Severe Weather\n Events in the U.S.\n from 1995 - 2011")
injuriesPlot <- gplot(EVTYPE, data = injuries, weight = INJURIES, geom = "bar") +
    scale y continuous("Number of Injuries") +
    theme(axis.text.x = element_text(angle = 45,
    hjust = 1)) + xlab("Severe Weather Type") +
    ggtitle("Total Injuries by Severe Weather\n Events in the U.S.\n from 1995 - 2011")
grid.arrange(fatalitiesPlot, injuriesPlot, ncol = 2)
```

Based on the above histograms, we find that excessive heat and tornado cause most fatalities; tornato causes most injuries in the United States from 1995 to 2011.

As for the impact on economy, we have got two sorted lists below by the amount of money cost by damages.

property

And the following is a pair of graphs of total property damage and total crop damage affected by these severe weather events.

```
propertyPlot <- qplot(EVTYPE, data = property, weight = propertyDamage, geom = "bar") +</pre>
    theme(axis.text.x = element text(angle = 45, hjust = 1)) + scale y continuous("Property Dam
age in US dollars")+
   xlab("Severe Weather Type") + ggtitle("Total Property Damage by\n Severe Weather Events in\
n the U.S. from 1995 - 2011")
cropPlot<- qplot(EVTYPE, data = crop, weight = cropDamage, geom = "bar") +</pre>
    theme(axis.text.x = element_text(angle = 45, hjust = 1)) + scale_y_continuous("Crop Damage
in US dollars") +
   xlab("Severe Weather Type") + ggtitle("Total Crop Damage by \nSevere Weather Events in\n th
e U.S. from 1995 - 2011")
grid.arrange(propertyPlot, cropPlot, ncol = 2)
```

Based on the above histograms, we find that **flood** and **hurricane/typhoon** cause most property damage; **drought** and flood causes most crop damage in the United States from 1995 to 2011.

Conclusion

From these data, we found that excessive heat and tornado are most harmful with respect to population health, while flood, drought, and hurricane/typhoon have the greatest economic consequences.
